

NAME:

EID:

M 427K Exam 2 Version B November 13, 2012 Instructor: James Pascaleff

Problem	Possible	Actual
1	10	
2	7	
3	20	
4	10	
5	5	
6	15	
7	18	
8	15	
Total	100	

INSTRUCTIONS:

- Do all work on these sheets.
- Show all work.
- No books, notes, calculators, or other electronic devices.

HIGHER ORDER EQUATIONS

1. (10 points) Find the general solution of the fourth order equation

$$y^{(4)} - 5y'' + 6y = 0$$

POWER SERIES

2. (7 points) Find the radius of convergence of the series

$$\sum_{n=0}^{\infty} \frac{2^n x^n}{n!}$$

3. (20 points) Seek a power series solution of the following equation at the point $x_0 = 0$:

$$y'' + 2xy' + y = 0$$

Find the recurrence relation, and determine the terms, up to the x^3 term, of the solution that begins with $a_0 = 0$, $a_1 = 1$.

4. (10 points) The following two equations have a singular point at $x_0 = 0$. One of them has a regular singular point, while the other has an irregular singular point.

$$\text{Equation (A) } x^2y'' + 3xy' + 5y = 0$$

$$\text{Equation (B) } x^2y'' + 2y' + y = 0$$

- (a) (4 points) Which equation has a regular singularity, and which has an irregular singularity? Circle your answer below.

(A) is regular, and (B) is irregular. OR (B) is regular, and (A) is irregular.

- (b) (6 points) Justify your answer to the previous part using limits.

LAPLACE TRANSFORM

5. (5 points) Write the definition of the Laplace transform of a function $f(t)$.
6. (15 points, 5 points per part) Here are some functions of s . Find their inverse Laplace transforms. The answer may have discontinuities or delta functions in it.

(a) $F(s) = \frac{2s - 3}{s^2 + 2s + 10}$

(b) $F(s) = \frac{s(e^{-s} - e^{-2s})}{s^2 + 9}$

(c) $F(s) = \frac{6G(s)}{s^4}$

For this part, $G(s) = \mathcal{L}\{g(t)\}$, and your answer will be in terms of $g(t)$.

7. (18 points, 6 points per part) A mass on a spring with mass $m = 4$, damping $\gamma = 2$, spring constant $k = 2$, and subject to an external force $g(t)$ obeys the differential equation

$$4y'' + 2y' + 2y = g(t)$$

We impose the initial conditions $y(0) = 2$, $y'(0) = -1$. In each of the scenarios below, solve for $Y(s)$, the Laplace transform of $y(t)$. Do not take the inverse transform of your answer.

- (a) First scenario: No forcing, $g(t) = 0$.

- (b) Second scenario: The forcing function $g(t)$ consists of three delta-function impulses at times $t = \pi$, $t = 2\pi$, and $t = 3\pi$:

$$g(t) = \delta(t - \pi) + \delta(t - 2\pi) + \delta(t - 3\pi)$$

- (c) Third scenario: The forcing function $g(t)$ is zero up until time $t = \pi$, at which time it switches on to $\sin(t - \pi)$, or in symbols:

$$g(t) = \begin{cases} 0 & \text{if } t < \pi \\ \sin(t - \pi) & \text{if } t \geq \pi \end{cases}$$

FIRST ORDER SYSTEMS

8. (15 points) Find the eigenvalues and eigenvectors of the matrix \mathbf{A} , and find the general solution of the system $\mathbf{x}' = \mathbf{A}\mathbf{x}$

$$\mathbf{A} = \begin{pmatrix} 1 & 1 \\ 0 & -2 \end{pmatrix}$$
